Evidence-based thinking in clinical medicine has impacted greatly on the physician's approach to clinical care. Evidence-Based Dermatology introduces and encourages the concept of evidence-based patient care in dermatology. Incorporating a text that is much more than merely the summary of trial data, the authors worked to explore disease mechanisms and treatments in greater depth and detail in order to provide more insight for the reader. In addition to promoting the understanding of the evidence-based philosophy, the authors have focused on some of the fundamentals in dermatology that need to be approached differently. Issues such as the interpretation of clinical research, disease-oriented evidence versus patient-care evidence, and the use of placebo are examined.

The new edition of The Best of Five MCQS for the European Specialty Examination in Gastroenterology and Hepatology is a question book designed to assist in preparations for the European Specialty Examination in Gastroenterology and Hepatology (ESEGH). The book has been fully updated to reflect the new examination introduced in 2018 and the most recent guidelines. Containing a foreword by Sir Ian Gilmore, former president of both the British Society for Gastroenterology and the Royal College of Physicians, the book adopts the same Best of Five question format used in the ESEGH and covers the breadth of the curriculum. It has been designed to exactly match the relative proportion of questions on each topic area found in the examination. Each of the 300 questions contained in the book is accompanied by an answer, a set of three succinct bullet points of key 'take-home' messages, and a short summary of the relevant background, evidence-base and up-to-date European guidelines. The book ends with a chapter of 50 questions, which again matches the proportions of topic areas found in the ESEGH, and is designed to act as a mock-examination for use in the final stages of preparation.

This volume is at once an all-inclusive guide to the meaning of hundreds of technical terms and ideas needed for ice cream manufacturing, as well as a practical introduction to the ingredients, freezing methods, flavoring, and packaging of ice cream, sherbet, sorbet, gelato, frozen yogurts, novelties and many other kinds of

frozen desserts. In dozens of longer entries and short essays, as well as with original quantitative tables and graphs, the authors explain the chemistry and controllable variables of all phases of ice cream production, e.g., dairy and non-dairy ingredients, crystallization, overrun, equipment, coloring, test and tasting protocols and much more. With its helpful system of cross-referencing, the book offers essential details on what must be done to create high-quality, successful products—with pointers on how to avoid dozens of specific defects that can occur during manufacturing, such as icy texture and sandiness. The authors also offer original information for extending product lines and creating new, e.g., health-oriented and hybrid products. Besides providing a definitive introduction to the applied science of frozen desserts, the book explains key management concepts from cost-reduction strategies to yield improvement, marketing, and regulatory compliance in formulation and labeling.

Kucers' The Use of Antibiotics Sixth Edition PMPH-USA

A consummate classic with a fresh approach to pediatric dermatology Children's skin is different. Maturation affects the epidermal barrier, the cutaneous microbiome, adnexal structures, vasculature, and transcutaneous absorption of drugs. The immature skin is more susceptible to pathogens and environmental disruption. Many genetic disorders are either present at birth or manifest early in childhood. Skin diseases thus present differently in children than in adults. Pediatric dermatology has seen significant advances over the last decade, particularly in the field of molecular genetics research, which has furthered our understanding of the pathogenesis of many skin diseases and the development of new approaches to treatment. This fourth edition of the Harper classic provides state-of-the-art information on all aspects of skin disease in children. It covers the diagnosis and treatment of all conditions - both common and rare - with a consistently evidence-based approach. Existing content has been refreshed and fully updated to reflect emerging thinking and to incorporate the latest in research and clinical data - especially at the genetic level. This new fourth edition includes: Greater focus on the genetics behind skin disease, including new genes/genodermatoses, progress in genetic analysis, and stem cell transplants Increased coverage of lasers and other technologies used to treat skin disease More summary tables, learning points, tables of differential diagnosis, and clinical algorithms for diagnosis and management Additional online features, including patient information links and multiple choice questions Harper's Textbook of Pediatric Dermatology delivers crucial clinical insights and up-to-date research information that spans the breadth of the field. As the most comprehensive reference book on this subject available, this revised fourth edition will support and guide the daily practice of both dermatologists and pediatricians across the world.

Practical Druggist and Pharmaceutical Review of Reviews CRC Press
Sequential and reciprocal interactions between oral epithelial and cranial neural crest-derived mesenchymal cells give rise to the teeth and periodontium. Teeth are vital organs containing a rich number of blood vessels and nerve fibers within the dental pulp and periodontium. Teeth are composed by unique and specific collagenous (dentin, fibrillar cementum) and non-collagenous (enamel) highly mineralized extracellular matrices. Alveolar bone is another collagenous hard tissue that supports tooth stability and function through its close interaction with the periodontal ligament. Dental hard tissues are often damaged after infection or traumatic injuries that lead to the partial or complete destruction of the functional dental and supportive tissues. Well-established protocols are routinely used in dental clinics for the restoration or replacement of the damaged tooth and alveolar bone areas. Recent progress in the fields of cell biology, tissue engineering, and nanotechnology offers promising opportunities to repair damaged or missing dental tissues. Indeed, pulp and periodontal tissue regeneration is progressing rapidly with the application of stem cells, biodegradable scaffolds, and growth factors. Furthermore, methods that enable partial dental hard tissue repair and regeneration are being evaluated with variable degrees of success. However, these cell-based therapies are still incipient and many issues need to be addressed before any clinical application. The understanding of tooth and periodontal tissues formation would be beneficial for improving regenerative attempts in dental clinics. In the present e-book we have covered the various aspects dealing with dental and periodontal tissues physiology and regeneration in 6 chapters: 1. General principles on the use of stem cells for regenerating craniofacial and dental tissues 2. The roles of nerves, vessels and stem cell niches in tissue regeneration 3. Dental pulp regeneration and mechanisms of various odontoblast functions 4. Dental root and periodontal physiology, pathology and regeneration 5. Physiology and regeneration of the bone using various scaffolds and stem cell populations 6. Physiology, pathology and regeneration of enamel using dental epithelial stem cells
